

The Orchids: Natural History And Classification

Ophrys bertolonii MORETTI, 1923
QUIBUS. PL. ITAL. 6: 9

Etymology: After A. Bertoloni (1775-1869), the Italian botanist.
Habitat: Sunlit, limestone soils, from dry phrygiana to densely covered meadows.

Description: Very easily recognised, but difficult to locate because this Italian species is found in Greece only on Corfu, where it was recorded last in 2003 by Klaus Beitz, and in Epirus, where it has been recorded in two localities near the Greek-Albanian border. Its sporadic and rare presence on Corfu and in Epirus, where it is usually represented by single individuals, indicates that the plants are transported in seed from Italy, over the Adriatic, by the west winds. It attracts the same pollinator as the commonly occurring *O. frysae-equianae*; maybe this competition for the same pollinator insect is the reason for the lack of establishment of this species in Greece. A characteristic is the dense lateral pilosity which reaches to the top of the lip, the latter turned upwards like a saddle. The stigmatic cavity is also unique, being open at the sides through characteristic lateral slits. The pseudo-eyes are inconspicuous, black, located at the lower surface of these slits. *O. bertolonii* is endangered in Greece, because of its rarity and the dense settlement and construction on Corfu.
